

MCP-CONNECTED ASSESSMENT
DELIVERY

Test with the agent. File as you go.

Point the AI agent you already use at DingoDocs. As it probes, fuzzes, and reads scanner output, it captures the command, the output, and the finding draft. You review. Then you issue the report.

[Book a call ↗](#)

One record from scope to retest.

DingoDocs follows the work instead of splitting it across documents, tickets, storage drives, and client email.

Scope Approve targets, rules, dates, and delivery responsibilities.	Capture The agent files CLI output, scanner results, notes, and evidence while it tests.	Review Prioritise findings through explicit authoring, peer review, and publication states.	Report Issue controlled, white-label reports from the findings the work already produced.	Verify Track client remediation and complete evidence-backed retests.
---	--	---	---	---

See what needs attention.

The workspace surfaces delivery state, review work, risk, and deadlines without turning the assessment into another dashboard project.

Engagements stay visible as active delivery work, not loose project records.

Scope stays attached

Approved targets, rules of engagement, assets, and methodology remain with the work they govern.

Evidence carries history

Classification, checksums, retention, legal holds, annotations, and finding links remain visible.

Clients see approved material

Named client contacts receive engagement-specific access to shared findings, reports, evidence, remediation, and retests.

Reports keep their versions

Render controlled PDF, DOCX, HTML, and Markdown deliverables from approved findings and evidence.

Publishing is a deliberate state change.

Findings carry structured technical detail, impact, remediation, evidence, comments, ownership, and review history.

Author with context

Keep executive summary, technical detail, reproduction, impact, remediation, and verification guidance together.

Review before release

Draft and review states remain visible. Reasoned overrides create audit records.

Separate visibility from publication

Client visibility is independent from internal approval, so delivery boundaries stay clear.

Retest without losing history

Retests preserve the original finding version while recording what changed and what was verified.

Reports built from approved work.

Assemble a controlled client deliverable after the content has earned its way through review.

The agent tests. DingoDocs files.

Connect an MCP client. While it probes, fuzzes, and reads scanner output, it stores evidence and finding drafts. You still publish.

Scoped credentials

MCP and API credentials use explicit scopes that match the work an integration is allowed to perform.

Draft-first imports

Scanner imports create drafts for human review rather than publishing directly to clients.

File as you go

Capture terminal output, ingest Nuclei, Nmap, Nessus, OpenVAS, ZAP, or Burp results, and draft finding write-ups in the same session.

Keep the person in the loop.

Automation moves work forward.
Publication remains an explicit decision.

Integrations and automation

Capture pen-test write-ups and evidence from the CLI with scoped MCP tools, alongside webhooks and automation.

BUILT FOR THE TERMINAL

MCP server for live testing notes

Give your CLI agent or scanner a scoped credential and stream evidence, testing-journal notes, timeline events, draft findings, and Nuclei/Nmap/Nessus/ZAP/Burp imports as the engagement happens. Every mutation uses the same tenant boundaries and audit trail as the web app. Imported findings stay draft until a consultant publishes them.

```
# stdio MCP (CLI agents)
DINGODOCS_URL=http://localhost:3000
DINGODOCS_API_KEY=dd_pot_... pnpm mcp

# HTTP MCP (scanners and unattended tools)
POST /api/mcp
Authorization: Bearer dd_svc_...
```

Tools include ingest_scanner_results, add_testing_note, add_timeline_entry, capture_evidence, create_finding_write_up, and attach_evidence. Recommended scopes: engagements:read, engagements:write, findings:read, findings:write, evidence:write, notes:write, imports:write.

API credentials

Personal and service credentials are hashed at rest. Plaintext appears once.

Scopes

☐ engagements:read

☐ clients:read

Signed webhooks

HMAC-SHA256 signatures include an event ID and timestamp. See the [webhooks](#) page for details.

☒ All events

Create webhook

Notification channels

In-app, SMTP, Teams, Slack, Discord, and generic webhook providers send titles and links only.

Create channel

Optional AI provider

Deployment default: disabled. Organisation: disabled

☐ Enable for this organisation

Save AI configuration

☐ I confirm this data may be sent to the configured provider and stored as an untrusted draft.

Generate untrusted draft

Integrations and automation inside the DingoDocs workspace.

CUSTOMER-CONTROLLED DEPLOYMENT

Your assessment data stays in your environment.

Operate DingoDocs inside your security boundary. Control identity, storage, access, backups, retention, integrations, and recovery.

Control the boundary

Choose how the application is deployed, accessed, backed up, and operated.

Keep material private

Customer-controlled infrastructure keeps sensitive assessment content in the environment you manage.

Procure on your terms

Choose direct commercial or AWS Marketplace procurement through Yuma IT.

See how DingoDocs fits your delivery model.
