

SECURITY ASSESSMENT DELIVERY

Run assessments from one place.

Keep scope, evidence, findings, reports, and remediation inside one customer-controlled, auditable workspace.

[Book a call ↗](#)

One record from scope to retest.

DingoDocs follows the work instead of splitting it across documents, tickets, storage drives, and client email.

Scope Approve targets, rules, dates, and delivery responsibilities.	Capture Bring notes, scanner output, files, and evidence into the engagement.	Review Move findings through explicit authoring, peer review, and publication states.	Report Issue controlled, white-label reports with immutable version history.	Verify Track client remediation and complete evidence-backed retests.
---	---	---	--	---

See what needs attention.

The workspace surfaces delivery state, review work, risk, and deadlines without turning the assessment into another dashboard project.

DingoDocs / Product brief

02

Keep every engagement in view.

Connect delivery work to the client, scope, evidence, findings, tasks, reports, and retests that give it meaning.

Engagements stay visible as active delivery work, not loose project records.

Scope stays attached

Approved targets, rules of engagement, assets, and methodology remain with the work they govern.

Evidence carries history

Classification, checksums, retention, legal holds, annotations, and finding links remain visible.

Clients see approved material

Named client contacts receive engagement-specific access to shared findings, reports, evidence, remediation, and retests.

Reports keep their versions

Render controlled PDF, DOCX, HTML, and Markdown deliverables from approved findings and evidence.

Publishing is a deliberate state change.

Findings carry structured technical detail, impact, remediation, evidence, comments, ownership, and review history.

Finding authoring with review controls and linked evidence.

Author with context

Keep executive summary, technical detail, reproduction, impact, remediation, and verification guidance together.

Review before release

Draft and review states remain visible. Reasoned overrides create audit records.

Separate visibility from publication

Client visibility is independent from internal approval, so delivery boundaries stay clear.

Retest without losing history

Retests preserve the original finding version while recording what changed and what was verified.

Reports built from approved work.

Assemble a controlled client deliverable after the content has earned its way through review.

Automation with an accountable boundary.

Capture from the tools testers already use while keeping credentials scoped and automated imports reviewable.

Scoped credentials

MCP and API credentials use explicit scopes that match the work an integration is allowed to perform.

Draft-first imports

Scanner imports create drafts for human review rather than publishing directly to clients.

Useful capture surface

Send notes, evidence, files, timeline events, finding drafts, and supported scanner output through governed interfaces.

Keep the person in the loop.

Automation moves work forward.
Publication remains an explicit decision.

The screenshot displays the 'Integrations and automation' section within the DingoDocs workspace. The interface is divided into several panels:

- API credentials:** A section for managing API credentials, including fields for 'Credential name', 'Personal access token', and 'Service account name (if applicable)'. It also features a 'Scopes' section with checkboxes for various permissions like 'engagements:read', 'clients:read', 'findings:write', 'tasks:read', 'evidence:write', 'imports:write', 'notifications:manage', 'engagements:write', 'findings:read', 'reports:read', 'tasks:write', 'notes:write', and 'webhooks:manage'. A 'Create credential' button is at the bottom.
- Signed webhooks:** A section for managing signed webhooks, including a 'Webhook name' field and a 'Webhook URL' field. It also has a 'Create webhook' button.
- Notification channels:** A section for managing notification channels, including a 'Channel name' field, a 'Webhook URL for Teams, Slack' field, and a 'User UUID for in-app' field. It also has a 'Create channel' button.
- Optional AI provider:** A section for managing an optional AI provider, including a 'Provider model identifier' field, an 'Optional provider base URL' field, and a 'Provider API key' field. It also has a 'Save AI configuration' button.

At the bottom of the workspace, there is a text box that reads: 'Integrations and automation inside the DingoDocs workspace.'

CUSTOMER-CONTROLLED DEPLOYMENT

Your assessment data stays in your environment.

Operate DingoDocs inside your security boundary. Control identity, storage, access, backups, retention, integrations, and recovery.

Control the boundary

Choose how the application is deployed, accessed, backed up, and operated.

Keep material private

Customer-controlled infrastructure keeps sensitive assessment content in the environment you manage.

Procure on your terms

Community source uses Apache License 2.0. Contact Yuma IT for commercial and AWS Marketplace procurement.

See how DingoDocs fits your delivery model.
